

JOIN THE ORGANIC CORN OUTBREAK!

NO-GMO POPCORN PUSH BACK THE GMO'S

This organic GMO-free popcorn is brought to you by the concerned citizens of Kaua'i, Hawaii.

Every genetically engineered food in the U.S. is on the market illegally and should be recalled for rigorous safety testing. The FDA has deliberately unleashed a host of potentially harmful foods onto American dinner tables in blatant violation of U.S. law.

The FDA's records reveal it declared genetically engineered foods to be safe in the face of disagreement from its own experts - all the while claiming a broad scientific consensus supported its stance. Internal reports and memoranda disclose:

(1) agency scientists repeatedly cautioned that foods produced through recombinant DNA technology entail different risks than do their conventionally produced counterparts.

(2) that this input was consistently disregarded by the bureaucrats who crafted the agency's current policy, which treats bio-engineered foods the same as natural ones.

(3) Most troubling, scientists say, are the unknown long-term health risks posed by GMOs, including potential increases in cancer. Such risks may only increase with the introduction of plants altered to produce bio active or toxic materials such as plastics, detergents, or pharmaceuticals.

Despite claims that GMO food products are based on "sound science," in truth, neither manufacturers nor the government has studied the effects of these genetically altered organisms or their new proteins on people - especially babies, the elderly, and the sick.

GMO seeds come from a small handful of companies - Monsanto, DuPont, Aventis, and Syngenta - tightening the grip of corporate control over international food production.
